

## Winter Canola Variety Trials in the Low to Intermediate-Rainfall Zone of Washington

Frank Young, Dale Whaley, Dennis Roe, Laban Molsee: WSU, Larry McGrew: USDA-ARS

In 2014, winter canola variety trials were established at Okanogan and Pomeroy, Washington. Fourteen varieties were planted at 1900' elevation at Okanogan, and 12 varieties at the Pomeroy site at 4400' elevation. Annual precipitation was 7" at Okanogan and 15" at Pomeroy. Plant establishment was visually evaluated 3 weeks after planting on a scale of 1 (poor establishment) to 5 (excellent establishment). Cold hardiness was determined by recording crop stand counts in the fall before freeze-up and in the spring after dormancy was broken. At Okanogan, the winter was cold, open, and very dry. Highest yielding varieties at Okanogan were Mercedes, Largo (Fig. 1), and Claremore, an imidazolone-tolerant variety. At Pomeroy, Griffin (Fig. 2) yielded the highest, followed by Amanda and Claremore. Largo had the highest survivability at both locations. A field tour was held at Pomeroy and attended by 75 growers, crop consultants, university faculty, staff and students, and agency representatives (Fig. 3).

### Winter canola variety trials in the low-intermediate rainfall zones of WA, 2014-2015.

Variety	Okanogan			Pomeroy		
	Yield (lbs/A)	Est.	Survival (%)	Yield (lbs/A)	Est.	Survival (%)
<b>DL Seeds Inc/Rubisco Seeds LLC</b>						
Mercedes	878	4.3	36	2470	4.5	18
